

Research Infrastructure and Capabilities for EO based Forest, Landscape and Ecosystem Research in Slovakia

Andrej Halabuk
Institute of Landscape Ecology
Slovak Academy of Sciences

Outline

1. Key Institutions
 2. Key Topics
 3. Key Infrastructure
- 

Landscape and Ecosystem Research

*Institute of Landscape Ecology
Slovak Academy of Sciences*

- **Interdisciplinary scientific institution for basic and applied research in landscape and ecosystem research (established in 1965)**
- **Total staff: 59 (scientific staff: 39; PhD students: 7)**

MODIS based analysis of NDVI time series

1. Grassland mapping

CLC

2. Grassland habitat classification

3. Grassland LSP

4. Detection of management practices

3. Detection of grassland management

Alluvial flooded meadows

Extensive grasslands-cut meadows

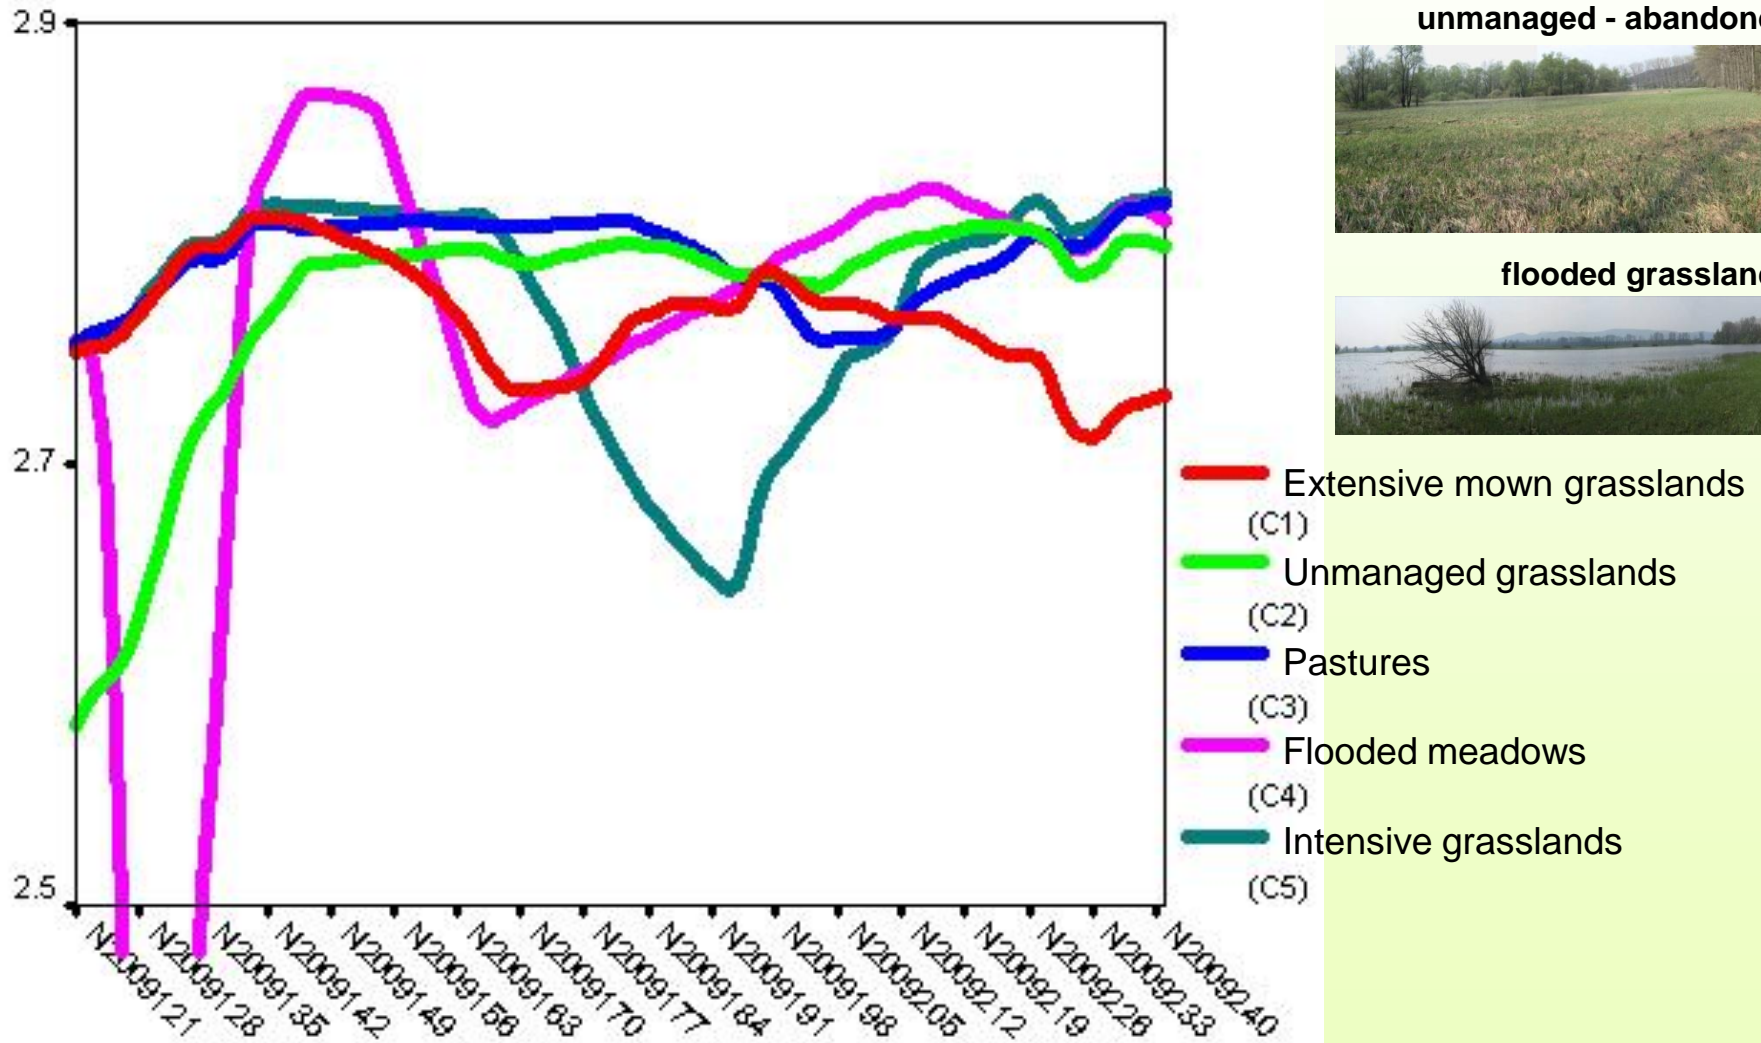

Intensive grasslands-pastures

Classification of BHC grasslands

- Based on within season trajectory of NDVI

- Extensive mown grasslands (C1)
- Unmanaged grasslands (C2)
- Pastures (C3)
- Flooded meadows (C4)
- Intensive grasslands (C5)

Cutting of hay meadows

Project ?

 Trend to graph: **Observed Curves**

GIS toolbar with icons for navigation, zoom, and analysis. Includes a dropdown menu and a play button.

I5188026_02620100612_rgbmodsin

Composer

- I5188026_02620100612
- 111_ttp_luka_poly
- rc1_2_37_raster group
- rc1_2_37_raster group
- rc1_2_37_raster group
- rc1_2_37_raster group

Composer panel with buttons: Add Layer, Remove Layer, Layer Properties, Map Properties, Feature Properties, Save, Print, and navigation icons.

Cutting of hay meadows

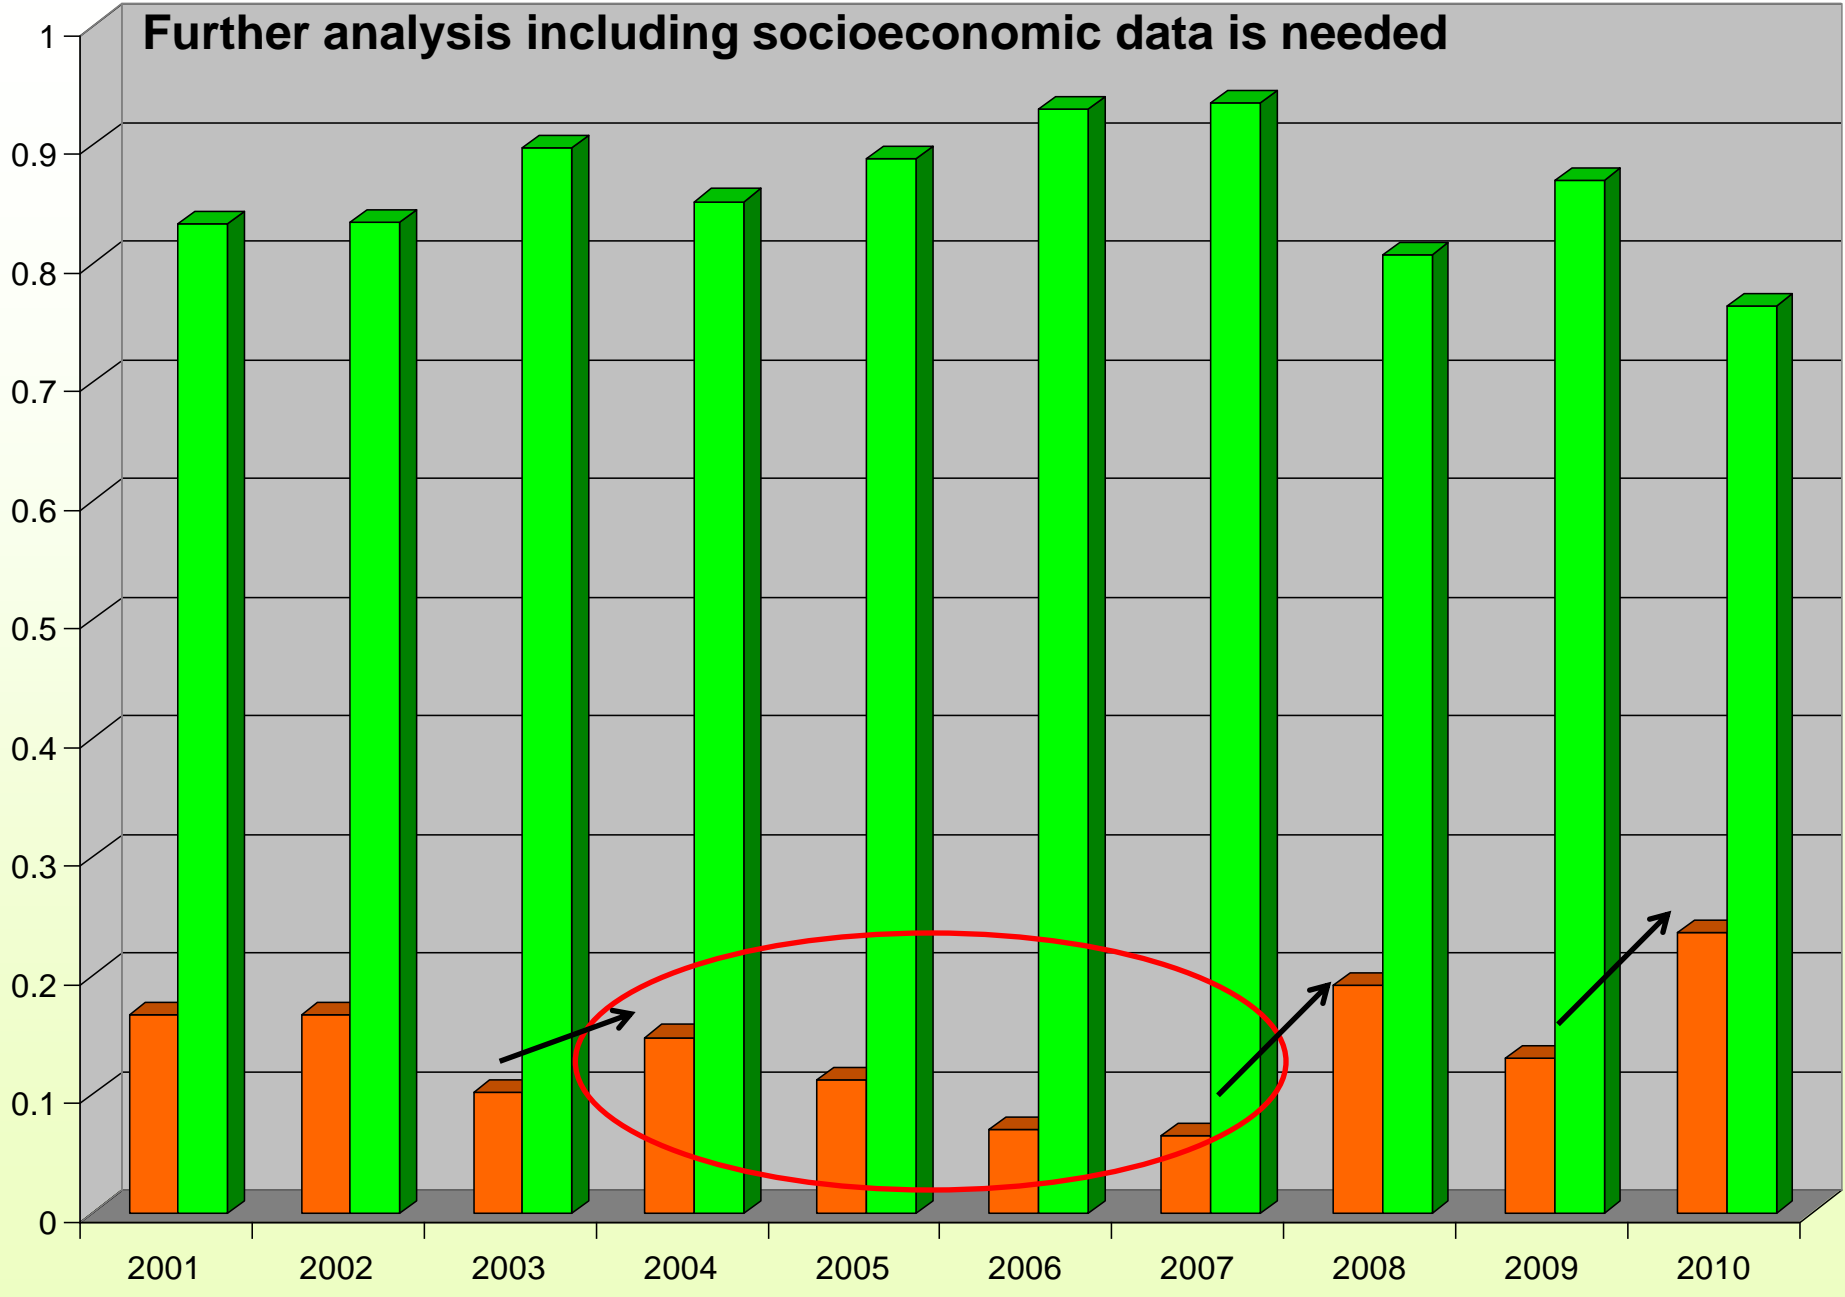

- Mainly remote and mountainous areas
- Further analysis needed including socioeconomic data
- Possible consequences – predictive modelling

Number of years managed from 2001 - 2010

unmanaged managed

Further analysis including socioeconomic data is needed

0 25 50 100 Kilometers

Bohunice

Mochovce

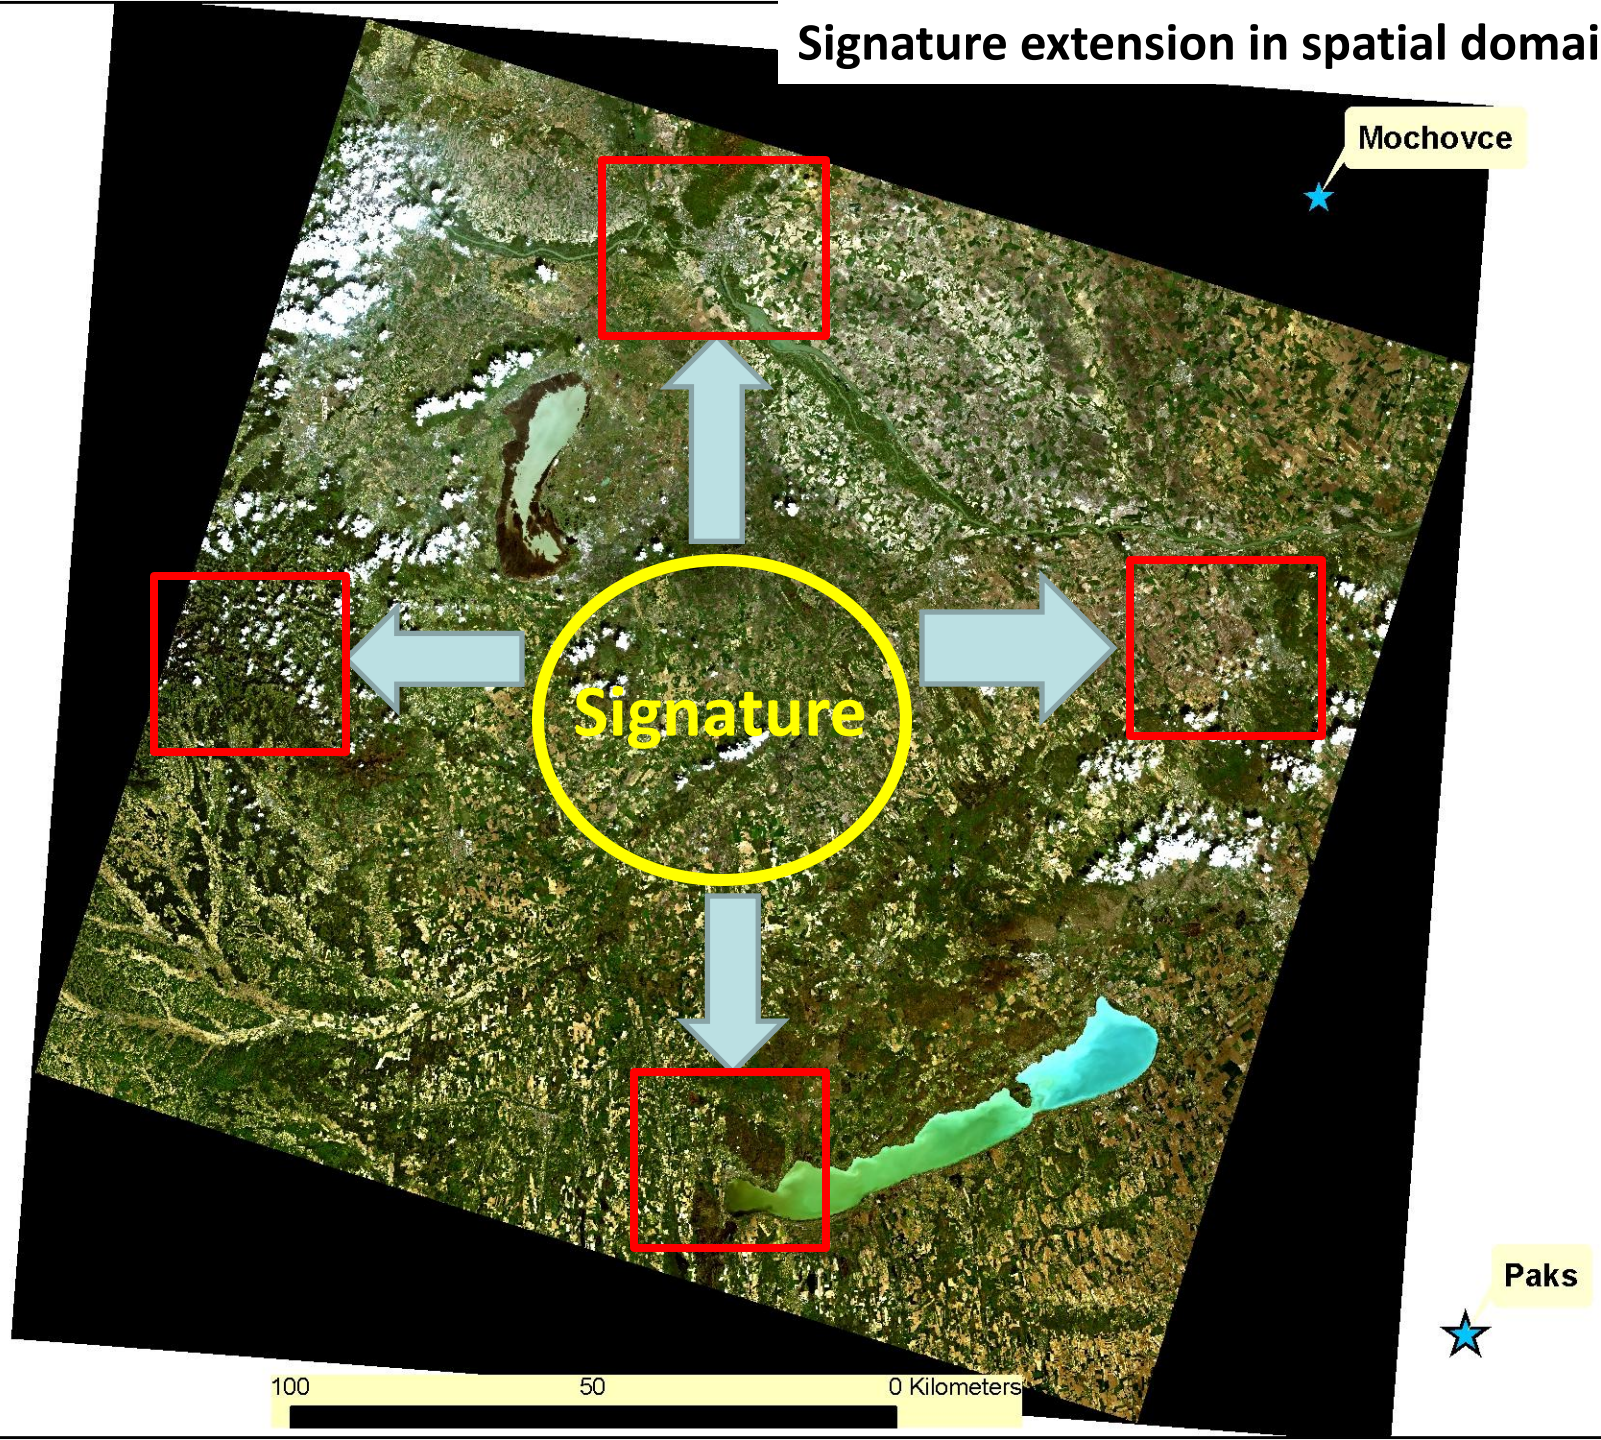

0 25 50 Kilometers

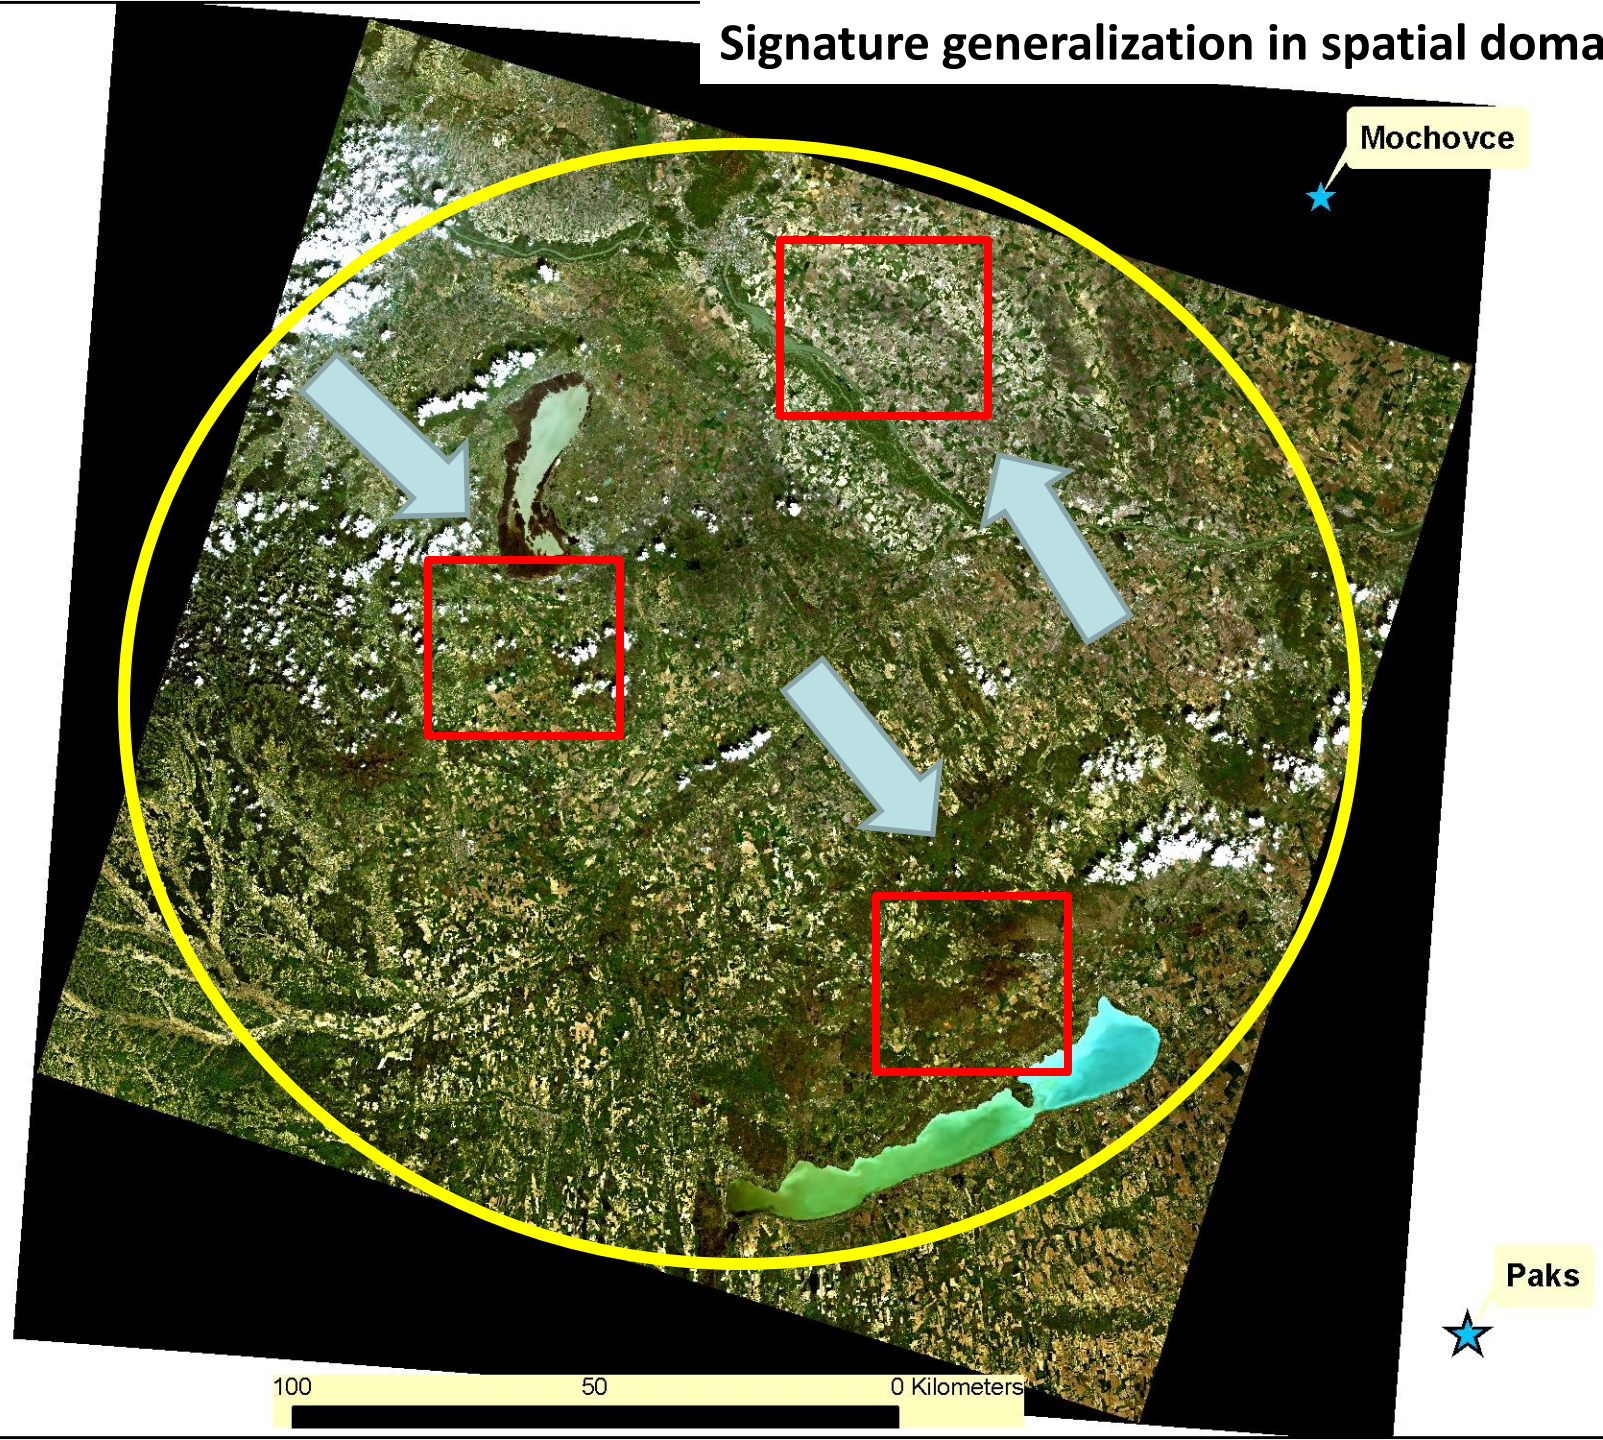

How to generalize – the issue of generalization

- Spatial – how far we can generalize crop signature?
 - region dependent – the function of crop practice similarity (eg. In areas with similar crop composition)
- Temporal - in areas with similar inter-seasonal (between year) variability
 - In general (from the research) – temporal is more successful than spatial)
- What is crucial – Atm. correction and temporal radiometric normalization – common scale – TOC SR
 - Optimization of the number of input predictors (as for the robustness for generalization)

Signature extension in spatial domain

Signature generalization in spatial domain

Signature extension in temporal domain

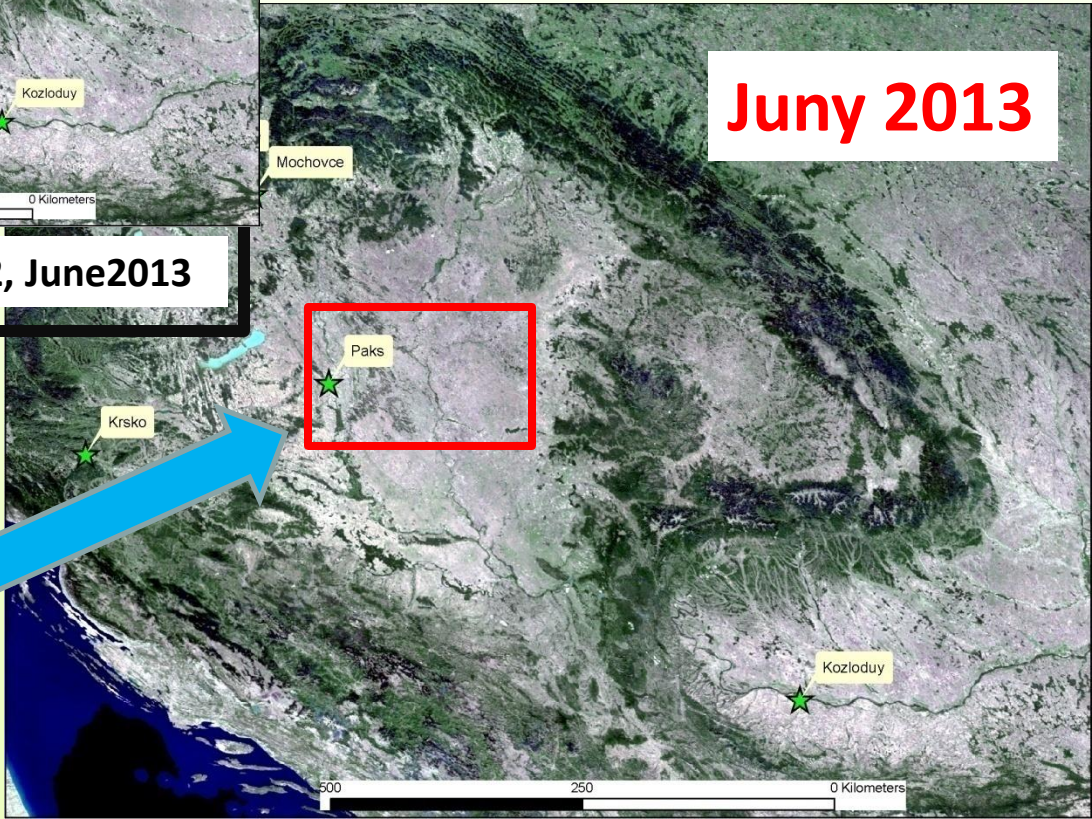

Signature generalization in temporal domain

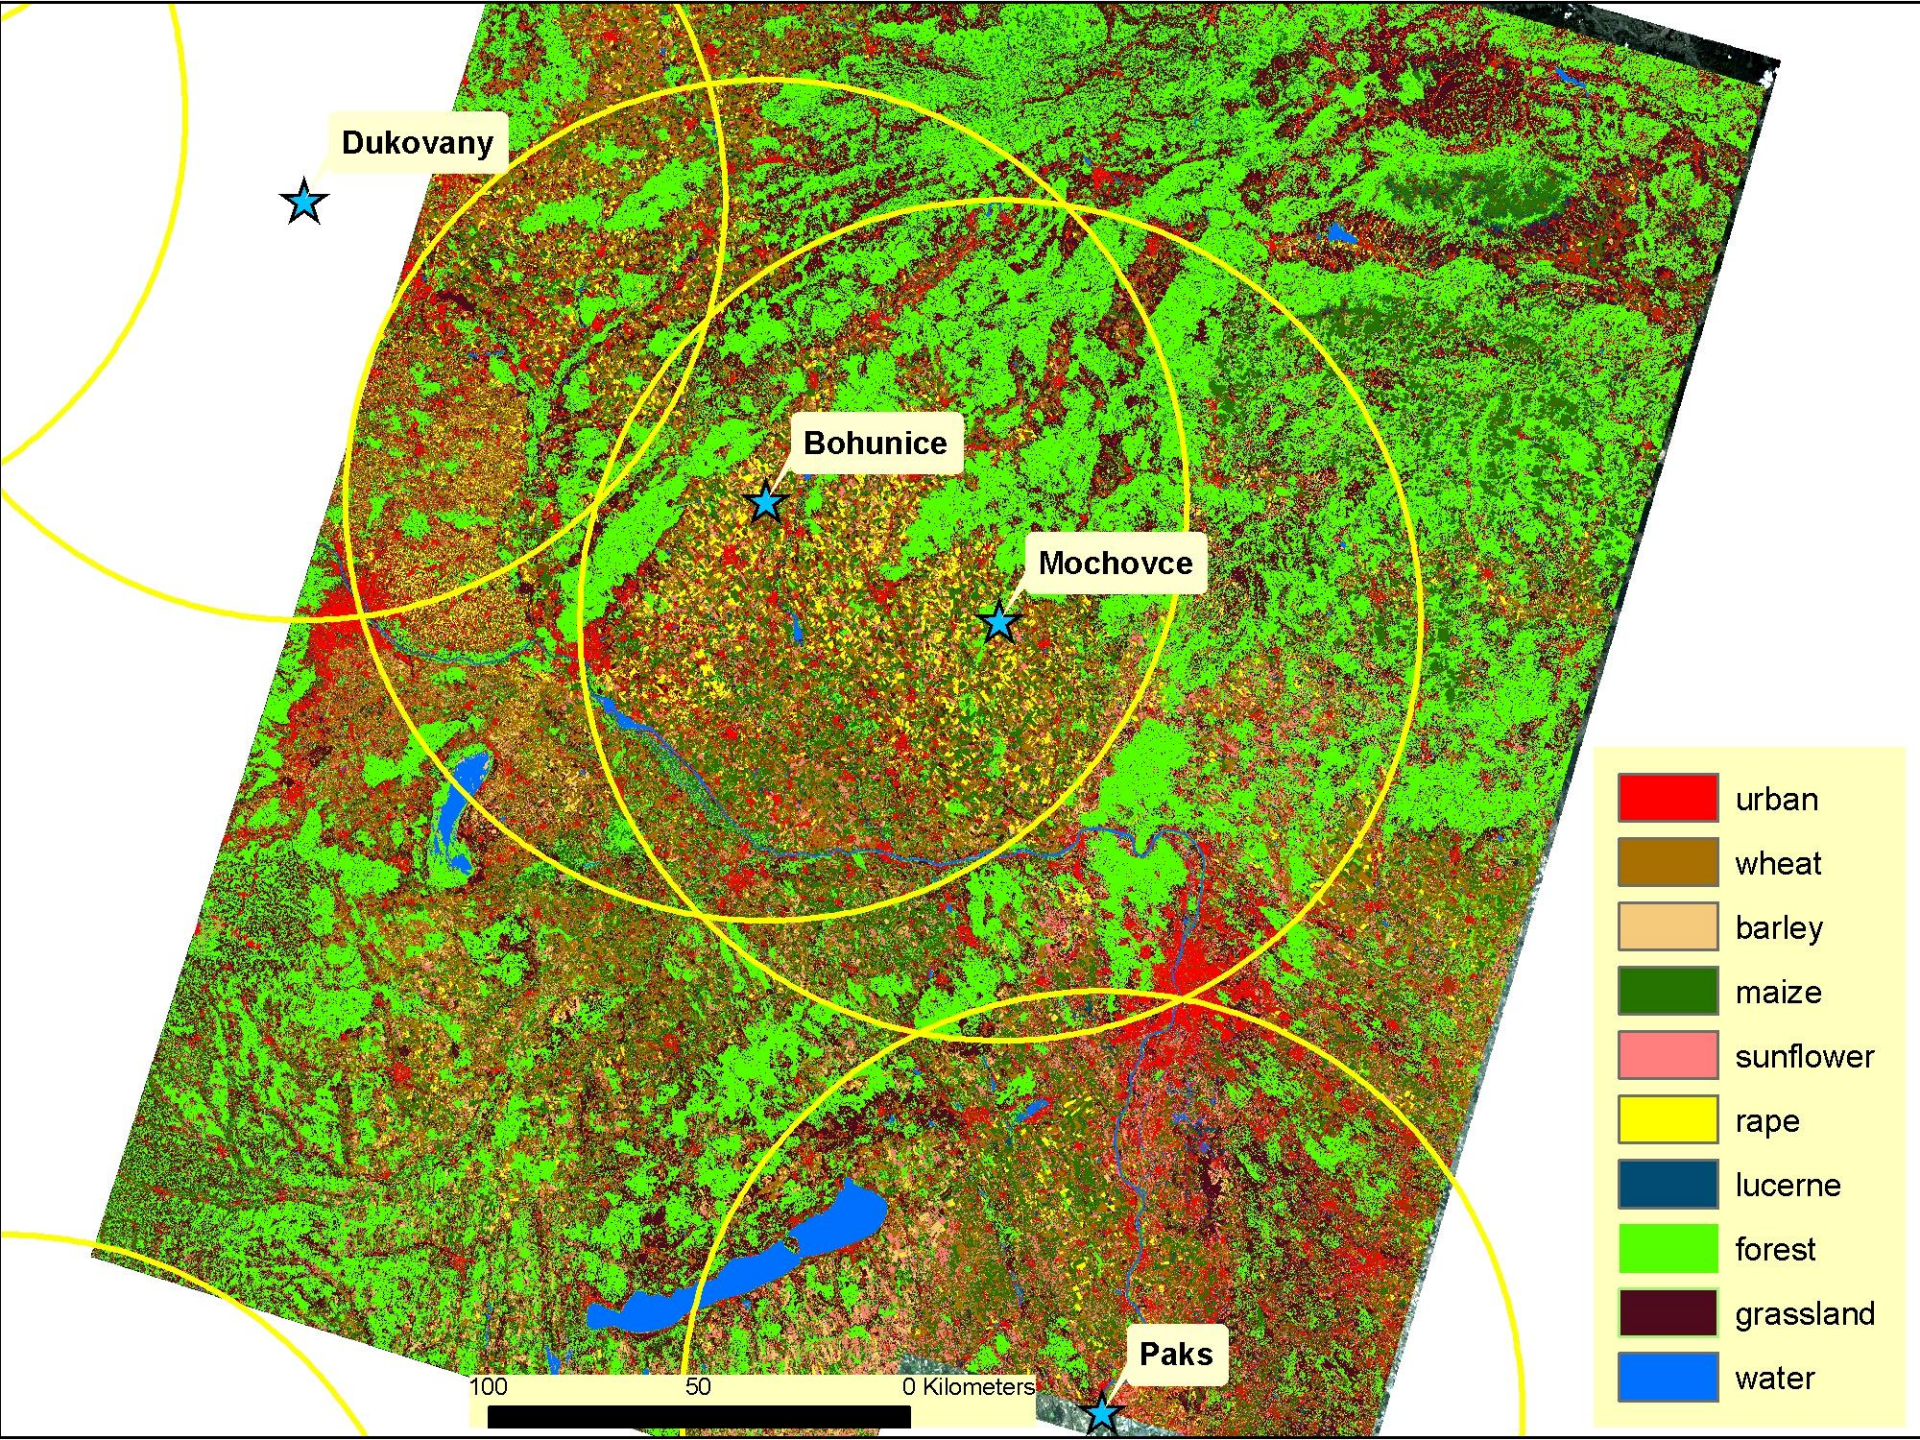

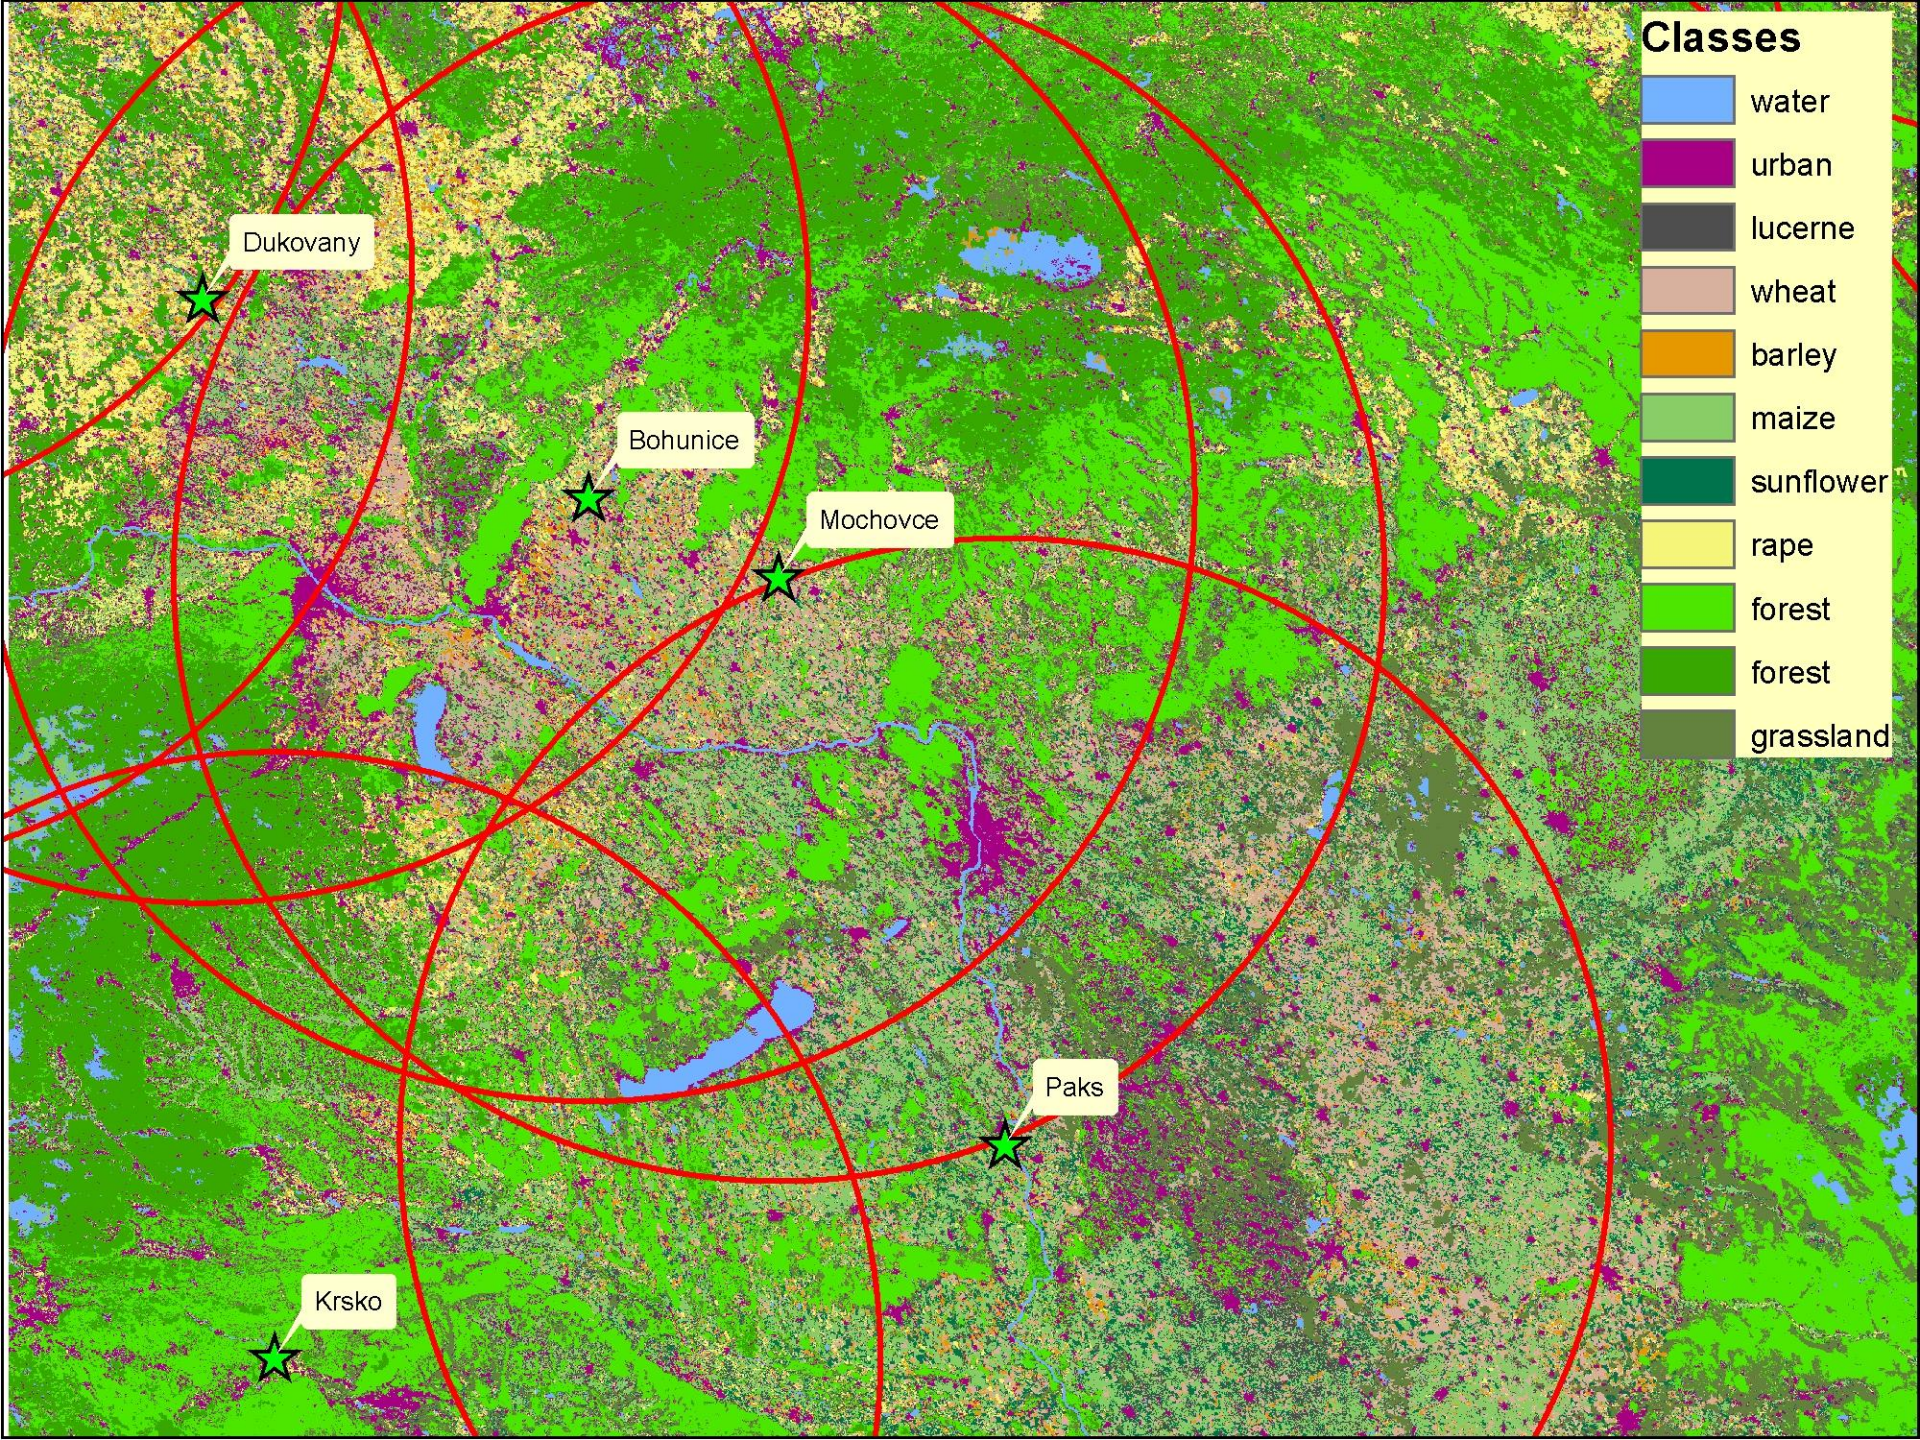

June2009, June2010, June2011, June2012, June2013

Signature

Better than for early season – OA 63% - grater spatial variability in early season

Errors decreased dramatically after the crop harvesting in late June

Landscape and Ecosystem Research

Key Capabilities and Infrastructure

Current and future research focus

- Optimal filtering of MODIS series for grassland studies and crop monitoring
- Early season crop prediction
- Testing of consistent classification methods allowing quarterly crop monitoring (signature extension and generalization)
- Optimization and minimalization of field training
- Data fusion MODIS and Landsat (prediction of Landsat NDVI series)

Forest Research Key Topics

- **improvement of monitoring and forest inventory methodologies, mainly by using Lidar data**
- **harmonization in building of software infrastructure and sharing of algorithms developed for processing Lidar data**
- **applying the research – building of operational products for forest mapping, forest management, forest production, forest protection, and other supporting ecosystem services (e.g. biodiversity, recreational, flood protection)**
- **providing web and map services to users, downscaling of global and continental products to national scale**

* údaj v zátvorke je trvanie fenofázy (dni)

Phenoprofile – softvér pre odvodnenie priebehu vegetačnej krivky zo satelitných snímok MODIS, vyvinutý v spolupráci NLC a TUZVO Zvolen

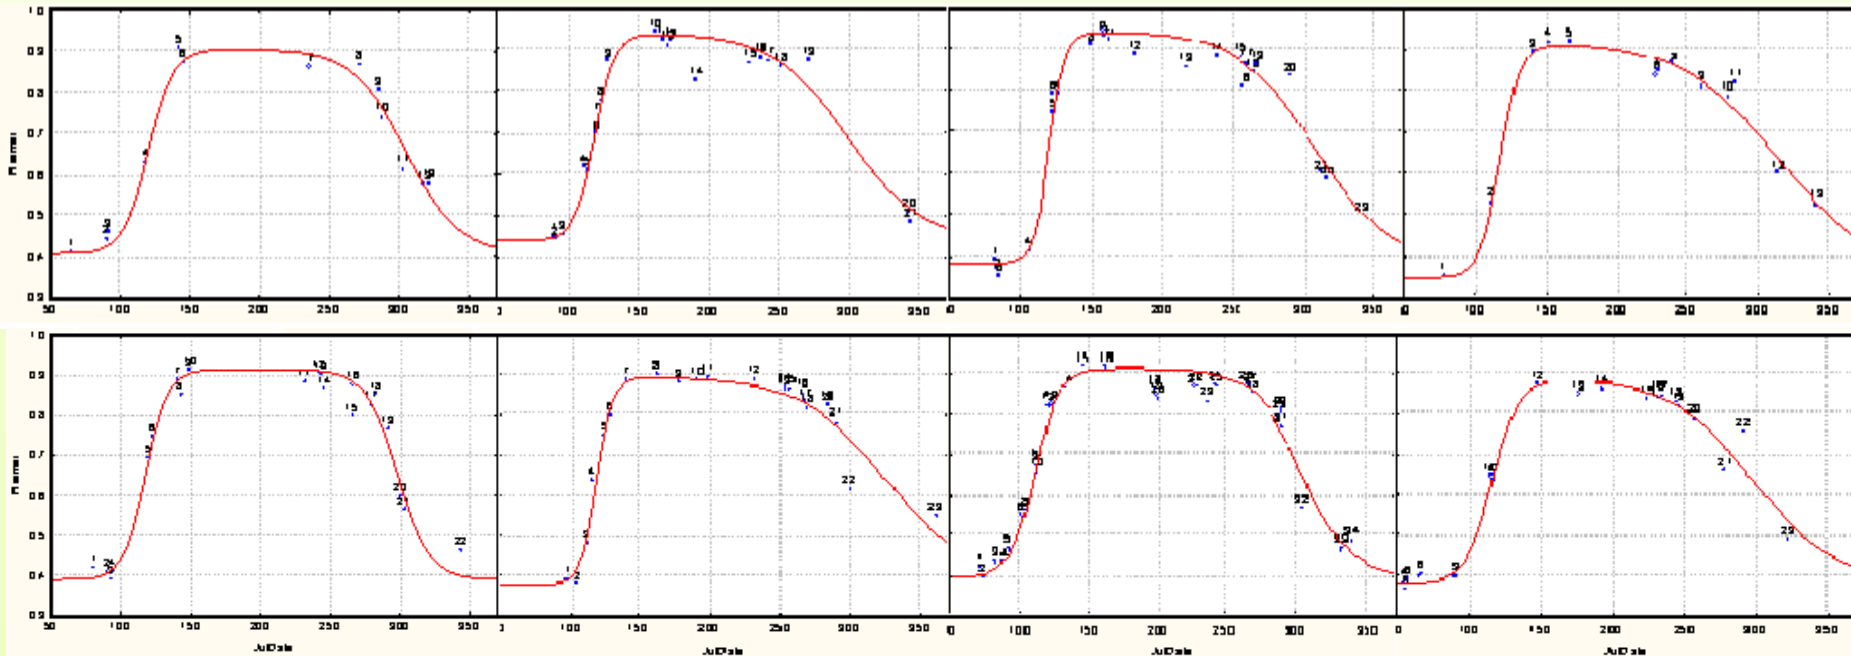

Phenological profile is approximated by function $f(t) = V_{min} + V_{amp} \left(\frac{1}{1 + e^{m_1 - n_1 t}} - \frac{1}{1 + e^{m_2 - n_2 t}} \right)$ where V_{min} , V_{amp} , m_1 , n_1 , m_2 , n_2 are appropriate parameters.

Its first derivative is equal to $f'(t) = V_{amp} \left(\frac{n_1 \cdot e^{m_1 - n_1 t}}{(1 + e^{m_1 - n_1 t})^2} - \frac{n_2 \cdot e^{m_2 - n_2 t}}{(1 + e^{m_2 - n_2 t})^2} \right)$

and second derivative to $f''(t) = V_{amp} \left(\frac{n_1^2 \cdot e^{2m_1 - 2n_1 t} \cdot (1 - e^{m_1 - n_1 t})}{(1 + e^{m_1 - n_1 t})^3} - \frac{n_2^2 \cdot e^{2m_2 - 2n_2 t} \cdot (1 - e^{m_2 - n_2 t})}{(1 + e^{m_2 - n_2 t})^3} \right)$

Priebehy krivky NDVI v rokoch 2001-2008: Čifáre, Quercus cerris
